Sasialek M. A. Method for Flame Research Based on Ionization Effects and its Application in Mining.

„Metoda badań płomienia oparta na zjawisku jonizacji i jej zastosowanie w górnictwie”. Górnictwo. No. 2, Kraków, 1934, PWN, pp. 27-35, 3 figs. GP

This paper reviews researches over inflammations of gaseous mixtures and coal dust by explosives. From his own experiments on ionization and luminosity effects occurring during the detonation of solid explosives, the author states that, to some extent, there is a conformity between the ionization effects on the inflammatory properties of solid explosives. His opinion is that by measuring the flow of ionization currents it is possible in some measure to obtain information regarding the inflammatory properties of explosives. It has been found by the author that the time of luminosity during the explosion of smokeless powder is in inverse proportion to the compactness of the loading, a fact which may be of importance in mining. The author suggests that for measuring the rapidity of flames in explosions of gases and coal dust in mines a method based on ionization effects should be used, since such a method would be more suitable than any other yet applied.

APPROVED FOR RELEASE: 08/31/2001

in the case of some explosives, the initial studies have, to a certain extent,
shown a conformity between the ionization effects and the inflammatory

2228. GASIFICATION OF PEAT IN SMALL CYLINDRICAL PIECES. Kouratov, A.P., Mil'karanovich, K.A., Basin, A.S., Mal, S.S. and Kadach, M.V. (Tr. Prck. (Peat Ind. Moscow), June 1954, 21-23.). Some figures are given for an experimental gasification, with a mixed air and steam blast, of peat cylinders 55 mm in diameter by 110 mm long instead of the usual 300 by 120 by 75 mm rods. The process was accelerated, but peat moisture and steam supply were not constant. (L).

TITLE: New Data on the Age of Garnet-Containing Liparite-Dacites of the Soviet Trans-Carpathians (Zakarpatt'ya) (Novyye dannyye o vozraste granatovykh liparito-datsitov sovetского Zakarpatt'ya)

PERIODICAL: Doklady AN SSSR, 1958, Vol. 118, Nr 2, pp. 369 - 372 (USSR)

ABSTRACT: Sprinklings of garnet exist in these comparatively small intrusive bodies of liparite-dacites. These intrusive bodies lie amid lava-pyroclastic rocks of an andesite composition of Pannonian age and in the neighboring rocks of the Cretaceous-Paleogenic flysh in the northwestern part of the Vigorlat-Gutinskaya volcanic chain (Massif Poprichnyy). The liparite-dacites were considered the youngest rocks and were placed higher than all effusives in stratigraphic schemes. In the relevant works (references 1, 18, 19) the problem of the age of the garnets in the total complex of volcanogenic rocks is hardly touched upon. According to Sobolev (reference 1) the formation of garnet must have taken place in considerable depths because of the high pressure necessary for it. In other words the peculiarity of these rocks might represent a very important moment in the coordination of the stratigraphic schemes of this region and East Slovakia (Slovakiya) where these rocks are comparatively

Card 1/3

20-2-47/60

New Data on the Age of Garnet-Containing Liparite-Dacites of the Soviet Trans-Carpathians (Zakarpat'ya)

widely spread. The exact dating of age can neither be made in Zakarpat'ye nor in Slovakiya, as no micro- and macrofauna was found. The authors analyze the rocks occurring here according to publications (references 4-11, 13-20). In them they consider 2 moments as especially important: 1) The garnet-containing rocks of the zone of foothills and of the northern slopes of the Poprichnyy massif in East-Slovakiya (and thus also those of the village of Perechin on the right bank of the Uzh-river) are according to a number of their petrographic-mineralogical and petrochemical properties identical, 2) the age-span from the Paleogenic to the Pannonian, in which these garnet rocks are placed, is confined to the range of Tortonian - Lower Sarmatian. It is not out of the question that the acid rocks of Perechin are of the same age as the Lower-Sarmatian liparites of the Beregovskoye hills. I. F. Trusova (reference 3) erroneously drew a parallel between all acid rocks of the Vygorlat-Gutinskaya volcanic chain (predominantly in the interfluvial region Borshava-Tissa) and the Beregovskoye-liparites. But they have a different age: the latter a Lower-Sarmatian Age, whereas the liparites and dacites of the volcanic chain gravitate towards the upper part of the Pannonian. The attempt made by Slavik (reference 12) to determine the age of the tuffs of Benyatin from

On the Connection of the Hydrothermal Lead-Zinc Mineralization With the Tectonics of the Rakhovskiy Massif (O svyazi gidrotermal'nogo svintsovo-tsinkovogo rudobrazovaniya s tektonikoy Rakhovskogo massiva)

PERIODICAL:

Dopovidi Akademii nauk Ukrain'skoi RSR, 1959, Nr 2, pp 194-197 (USSR)

ABSTRACT:

The author presents this article without any indication as to where he obtained his information. The occurrence of lead-zinc ores in the Rakhovskiy massif (Eastern Carpathians) has long been known and confirmed. Mineralization of this type is known chiefly in quartz-carbonate, quartz-barite and quartz-albine veins. A study of the tectonics of ore bodies leads to the inference that there are two types of mineralization of different ages. The first type is connected with quartz-albite veins.

Card 1/2

SOV/21-59-2-21/26

On the Connection of the Hydrothermal Lead-Zinc Mineralization
With the Tectonics of the Rakhovskiy Massif

The sulphide veinlets together with the veins and crystalline schists were crushed into microfolds during the Mesozoic orogenesis. The second type of mineralization is connected with quartz-carbonate and quartz-barite veins. These veins were formed after the eruption of the cretaceous diabases and are located along the alpine breaks. The diverse deformation of the veins in the zones of the inherited breaks, and at a distance from them, gives ground to an assumption that these veins were formed during the most intense of the alpine movements. There are 2 sketches and 3 Soviet references.

SPECTRA OF π MESON AND PROTON FORMATION IN GRAPHITE. N. M. Kucharyan, G. S. Sasyan, M. T. Arutyun, L. A. Kirakosyan, and A. A. Aleksandrov.

(Armenian Inst. of Physics). Izvest. Akad. Nauk S.S.S.R. Ser. Fiz. 19, 508-14 (1955) Sept.-Oct. (In Russian).

The measurements were made with a magnetic spectrometer with the magnetic field kept constant at 7100 Gs. A detailed scheme of the spectrometer, the tables of 308 observed negative π mesons at their energies and the experimental data of 1088 observed protons with energies $E > 0.05$ Bev generated by the neutrons in the layer of 7.3 g/cm² graphite + 0.54 g/cm² copper (counter walls) are given. The proton spectrum in the impulses of $p < 2$ Bev/c and the energy spectra of protons and negative π mesons generated on graphite absorber are also shown. (U.V.J.)

Inst : Phys. Inst. Arm. SSR Acad. of Sciences

Title : Nuclear Interactions of High Energy Protons in Copper.

Orig. Pub : Dokl. AN SSSR, 1956, 107, No 5, 668-670

Abstract : A cosmic ray spectrometer was used to determine the cross sections of interactions between protons with an average energy of 12 Bev and copper nuclei:

Energy range, Bev	Cross Section, Barns
0,91-1,38	0,755 0,14
1,38-2,38	0,676 0,07
2,38-5,50	0,750 0,09
5,50-oo	0,01 0,19

The authors determined earlier that for π -mesons the cross section equals the geometric cross section for energies greater than 1 Bev.

(Mekhanizatsiya i avtomatizatsiya drobil'nykh ustanovok za rubezhom)

PERIODICAL: Obogashcheniye rud, 1957, Nr 4, pp 64-69

ABSTRACT: Considerations are presented on the designing of large crushing installations and on research work. The principles of designing transporting facilities and the rules of their exploitation are indicated. Described are a device for emptying railroad cars, designs for the automation of the work of coarse and medium crushers, principles for the grouping of the equipment and the automation of auxiliary equipment.

TITLE: Setting standards for attenuation in telephone speech tract elements

SOURCE: Elektrosvyaz', no. 5, 1966, 64-71

TOPIC TAGS: telephone equipment, telephone network speech transmission, speech signal, scientific standard

ABSTRACT: A methodology which can be used to establish attenuation standards for the individual sections of a speech tract in local, inter-city, and international telephone communications which will provide for reaching the recommendations made by the International Telegraph and Telephone Consultative Committee (MKKTT) for values of equivalent attenuation (EZ) of transmission and reception volume and intelligibility (AEN) respectively, for 95% and 90% trunking is explained. Standards for attenuation in trunk lines and call circuit trunk lines for dial offices and toll offices (ATS-MTS) and for inter-station trunk lines for local communications are established. Orig. art. has: 2 formulas, 7 tables and 5 figures.
